Smart Khamari

An Integrated ML-Based Crop Disease Diagnostics and Location-Aware Resource Recommendation System

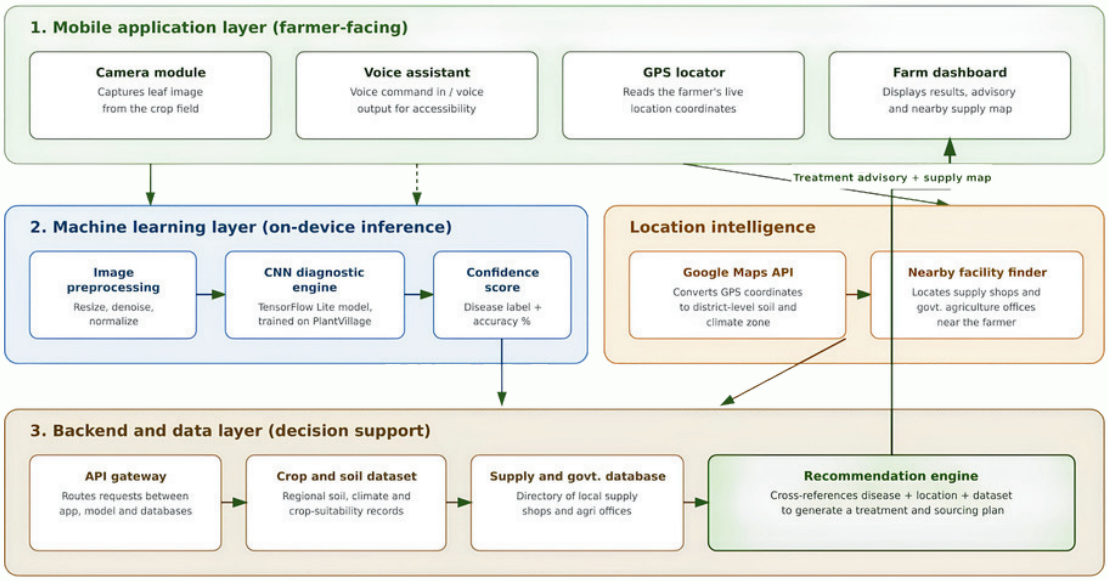

Introduction

- This project creates a smart mobile system for agricultural support.
- The app uses machine learning to identify diseases via image or voice.
- The system provides immediate treatment options and actionable remedies.
- The app delivers location-based crop recommendations using local data.

Objectives

- To develop CNN models for high-accuracy crop disease detection.
- To integrate Google Maps API for region-specific crop suggestions.
- To build location-aware tracking for nearby facilities and offices.
- To expand app datasets with fertilizer and pest guidelines.

System Architecture

Expected Outcomes

- Higher Crop Yield Through Early Detection
- Fast AI-Powered Disease Diagnosis
- Easy Voice-Based Accessibility
- Smart Location-Based Farm Planning
- Reduced Crop Loss and Better Resource Management

Limitations

- Accuracy Depends on Image Quality
- Internet Connection Required
- Limited Data Affects Recommendations
- Voice Recognition May Misinterpret Speech
- Older Devices May Experience Slow Performance
